

MINI PROJECT PROPOSAL

Name: OHENEBA KOFI NTI

Index no: 9030123

Reference: 20972619

Title of Project:

Student Event Discovery Platform for University Campus (EVENTWEB)

1. Introduction;

University campuses host numerous academic, social, religious, sporting, and entrepreneurial events throughout the semester. For the past 1 year being in the event organizing industry and I came to the realization that, many students are unaware of these events due to fragmented communication channels such as WhatsApp groups, posters, and word-of-mouth announcements. As a result, event organizers often experience low participation despite investing significant effort in planning.

This project proposes the development of a Student Event Discovery Platform that serves as a centralized system where students can discover, explore, and register for events happening on campus.

2. Problem Statement;

Students often miss valuable campus events because information about such events is scattered across multiple platforms. There is currently no unified system that allows students to easily find upcoming events based on their interests, location, and schedule.

3. Aim;

To design and develop a centralized platform that enables students to discover, explore, and receive information about events taking place on campus.

4. Objectives;

- To create a database for storing event information.
- To develop a platform where event organizers can publish events.
- To allow students to browse and search for events.
- To categorize events into academic, social, sports, religious, and business activities.
- To provide event reminders and registration functionality.
- To evaluate the effectiveness of the platform through user testing.

5. Scope;

The project will focus on event discovery and registration within a university environment. It will include event posting, browsing, searching, categorization, and registration features. The project will not include payment processing or advanced ticketing systems.

6. Methodology;

- Requirements gathering
- System analysis and design
- Database design
- Frontend development
- Backend development
- Testing and evaluation
- Documentation

7. Technologies;

- React.js

- Node.js/Express
- MySQL or PostgreSQL
- HTML/CSS/JavaScript
- Git and GitHub

8. Expected Outcome;

The project is expected to produce a functional web application that improves awareness and participation in campus events by providing students with a centralized platform for event discovery.

9. Conclusion;

The proposed Student Event Discovery Platform aims to improve communication and student engagement by simplifying access to information about campus events. The platform will serve as a useful tool for both students and event organizers.

FUTURE UPDATES;

- Mobile app version with push notifications.
